

COUNTRY CLUB BLEND MULCH

WM Agri Service Quality Parameters

Product Description and Production Benefits Application

- Country Club Blend is a mulch with a loose texture.
- Country Club Blend is a blend of Ag Grind Mulch and Forest Fines.
- Moisture content at the time of marketing is approximately 25%.
- Typical particle size is 2-inch minus.
- One cubic yard of Country Club Blend weighs approximately 500 to 650 pounds.

Benefits

- Country Club Blend Mulch is specifically designed for use in annual and perennial garden beds.
- Country Club Blend enhances the aesthetics and functionality of perennial or annual beds while providing long term improvement of soil tilth.
- Improves water filtration, increases the soil's water holding capacity and creates a nutrient reservoir.
- Decreases weeding, improves plant health and disease resistance.
- Enhances microbial activity by providing an established population of beneficial microbes. This activity is essential for mineralization and plant nutrient uptake, as well as disease suppression.
- Country Club Blend is intended to last longer than our Everbloom Mulch.

Application

- Apply over soil after planting or around existing plantings.
- An application rate of six to nine cubic yards per 1000 square feet is recommended for a two to three inch thick mulch layer.
- Avoid direct contact with plant stems by pulling mulch several inches back from the plant crown or stems.
